

Pull in Git:

1. Create a new file in the same github repository origin named test for example and click commit change.

2. Now use git pull command to pull or display the changes made in the repository.

```
vepur@DESKTOP-3335 MINGW64 ~/OneDrive/Desktop/abcd/git (main)
$ git pull
Updating 19de8ff..eda1ee7
Fast-forward
 test | 1 +
 1 file changed, 1 insertion(+)
 create mode 100644 test

vepur@DESKTOP-3335 MINGW64 ~/OneDrive/Desktop/abcd/git (main)
$
```

3. Thus, git pull displays the committed changes in the local storage of the same file
